

Sorting

In Place vs. not in Place Sorting

In place sorting algorithms are those, in which we sort the data array, without using any additional memory.

What about **selection**, **bubble**, **insertion** sort algorithms?

- Well, our implementation of these algorithms is **IN PLACE**.
- The thing is, if we use a **constant** amount of extra memory (like one temporary variable/s); the sorting is **In-Place**.

But in case extra memory (**merging** sort algorithm), which is **proportional** to the input data size, is used, then it is **NOT IN PLACE** sorting.

- But because memory these days is so cheap, that we usually don't bother about using extra memory, **if** it makes the program run faster.

Stable vs. Unstable Sort

3	5	2	1	5'	10	Unsorted Array
1	2	3	5	5'	10	Stable sort
1	2	3	5'	5	10	Unstable Sort

Example: Insertion Sort Code:

```
public void sort(int[] data) {
    for (int i = 0; i < data.length; i++) {
        int current = data[i];
        int j = i - 1;
        while (j >= 0 && data[j] > current) {
            data[j + 1] = data[j];
            j--;
        }
        data[j + 1] = current;
    }
}
```

```
public void sort(int[] data) {
    for (int i = 0; i < data.length; i++) {
        int current = data[i];
        int j = i - 1;
        while (j >= 0 && data[j] >= current) {
            data[j + 1] = data[j];
            j--;
        }
        data[j + 1] = current;
    }
}
```

**Example:**

Unsorted Array

Name	Age
Bob	25
Kevin	24
Stuart	21
Kevin	28

1) Sorted By Age

Name	Age
Stuart	21
Kevin	24
Bob	25
Kevin	28

2) Sorted By
Name (Stable)

Name	Age
Bob	25
Kevin	24
Kevin	28
Stuart	21

3) Sorted By Name
(Unstable)

Name	Age
Bob	25
Kevin	28
Kevin	24
Stuart	21

<http://www.sorting-algorithms.com/>

								
Random								
Nearly Sorted								
Reversed								
Few Unique								

Selection Sort

- In iteration i , find index **min** of smallest remaining entry.
- Swap **$a[i]$** and **$a[\text{min}]$** .

Demo:

Java implementation:

```
public class Selection
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
        {
            int min = i;
            for (int j = i+1; j < N; j++)
                if (less(a[j], a[min]))
                    min = j;
            exch(a, i, min);
        }
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }

    private static void exch(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

Mathematical analysis:

- Selection sort uses $(N-1) + (N-2) + \dots + 1 + 0 \approx N^2/2$ compares and N exchanges.

Trace of selection sort:

- Running time insensitive to input: **Quadratic time, even if input is sorted.**
- Data movement is minimal: **Linear number of exchanges.**

		a[]										
i	min	0	1	2	3	4	5	6	7	8	9	10
		S	O	R	T	E	X	A	M	P	L	E
0	6	S	O	R	T	E	X	A	M	P	L	E
1	4	A	O	R	T	E	X	S	M	P	L	E
2	10	A	E	R	T	O	X	S	M	P	L	E
3	9	A	E	E	T	O	X	S	M	P	L	R
4	7	A	E	E	L	O	X	S	M	P	T	R
5	7	A	E	E	L	M	X	S	O	P	T	R
6	8	A	E	E	L	M	O	S	X	P	T	R
7	10	A	E	E	L	M	O	P	X	S	T	R
8	8	A	E	E	L	M	O	P	R	S	T	X
9	9	A	E	E	L	M	O	P	R	S	T	X
10	10	A	E	E	L	M	O	P	R	S	T	X
		A	E	E	L	M	O	P	R	S	T	X

Trace of selection sort (array contents just after each exchange)

entries in black are examined to find the minimum

entries in red are a[min]

entries in gray are in final position

Insertion Sort

- In iteration i , swap $a[i]$ with each larger entry to its left.

Demo:

Java implementation:

```
public class Insertion
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
            for (int j = i; j > 0; j--)
                if (!less(a[j], a[j-1]))
                    exch(a, j, j-1);
                else break;
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }

    private static void exch(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

Mathematical analysis:

- To sort a randomly-ordered array with distinct keys, insertion sort uses $\approx \frac{1}{4}N^2$ compares and $\approx \frac{1}{4}N^2$ exchanges on average.
- Expect each entry to move halfway back.

Trace of insertion sort:

- Best case:** If the array is in ascending order, insertion sort makes $N-1$ compares and 0 exchanges.
- Worst case:** If the array is in descending order (and no duplicates), insertion sort makes $\approx \frac{1}{2}N^2$ compares and $\approx \frac{1}{2}N^2$ exchanges.
- For **partially-sorted** arrays, insertion sort runs in linear time.

		a[]										
i	j	0	1	2	3	4	5	6	7	8	9	10
		S	O	R	T	E	X	A	M	P	L	E
1	0	O	S	R	T	E	X	A	M	P	L	E
2	1	O	R	S	T	E	X	A	M	P	L	E
3	3	O	R	S	T	E	X	A	M	P	L	E
4	0	E	O	R	S	T	X	A	M	P	L	E
5	5	E	O	R	S	T	X	A	M	P	L	E
6	0	A	E	O	R	S	T	X	M	P	L	E
7	2	A	E	M	O	R	S	T	X	P	L	E
8	4	A	E	M	O	P	R	S	T	X	L	E
9	2	A	E	L	M	O	P	R	S	T	X	E
10	2	A	E	E	L	M	O	P	R	S	T	X
		A	E	E	L	M	O	P	R	S	T	X

Trace of insertion sort (array contents just after each insertion)

entries in gray do not move

entry in red is a[j]

entries in black moved one position right for insertion

Shell Sort

Idea: Move entries more than one position at a time by **h-sorting** the array.
an **h-sorted** array is **h** interleaved sorted subsequences:

Shell sort: [Shell 1959] **h-sort** array for decreasing sequence of values of **h**.

input	S	H	E	L	L	S	O	R	T	E	X	A	M	P	L	E
13-sort	P	H	E	L	L	S	O	R	T	E	X	A	M	S	L	E
4-sort	L	E	E	A	M	H	L	E	P	S	O	L	T	S	X	R
1-sort	A	E	E	E	H	L	L	L	M	O	P	R	S	S	T	X

How to **h-sort** an array? Insertion sort, with stride length **h**.

3-sorting an array

M	O	L	E	E	X	A	S	P	R	T
E	O	L	M	E	X	A	S	P	R	T
E	E	L	M	O	X	A	S	P	R	T
E	E	L	M	O	X	A	S	P	R	T
A	E	L	E	O	X	M	S	P	R	T
A	E	L	E	O	X	M	S	P	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T

Shell sort example: increments **7, 3, 1**

input	S	O	R	T	E	X	A	M	P	L	E
7-sort	S	O	R	T	E	X	A	M	P	L	E
	M	O	R	T	E	X	A	S	P	L	E
	M	O	R	T	E	X	A	S	P	L	E
	M	O	L	T	E	X	A	S	P	R	E
	M	O	L	E	E	X	A	S	P	R	T
3-sort	M	O	L	E	E	X	A	S	P	R	T
	E	O	L	M	E	X	A	S	P	R	T
	E	E	L	M	O	X	A	S	P	R	T
	E	E	L	M	O	X	A	S	P	R	T
	A	E	L	E	O	X	M	S	P	R	T
	A	E	L	E	O	X	M	S	P	R	T
	A	E	L	E	O	P	M	S	X	R	T
	A	E	L	E	O	P	M	S	X	R	T
	A	E	L	E	O	P	M	S	X	R	T
1-sort	A	E	L	E	O	P	M	S	X	R	T
	A	E	L	E	O	P	M	S	X	R	T
	A	E	L	E	O	P	M	S	X	R	T
	A	E	E	L	O	P	M	S	X	R	T
	A	E	E	L	O	P	M	S	X	R	T
	A	E	E	L	O	P	M	S	X	R	T
	A	E	E	L	M	O	P	S	X	R	T
	A	E	E	L	M	O	P	S	X	R	T
	A	E	E	L	M	O	P	R	S	X	T
	A	E	E	L	M	O	P	R	S	X	T
result	A	E	E	L	M	O	P	R	S	T	X

Shell sort: which increment sequence to use?

- **Powers of two:** 1, 2, 4, 8, 16, 32, ...
- **Powers of two minus one:** 1, 3, 7, 15, 31, 63, ...
- **3x+1:** 1, 4, 13, 40, 121, 364, ...

No

Maybe

OK. Easy to compute

Java implementation

```
public class Shell
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;

        int h = 1;
        while (h < N/3) h = 3*h + 1; // 1, 4, 13, 40, 121, 364, ...

        while (h >= 1)
        { // h-sort the array.
            for (int i = h; i < N; i++)
            {
                for (int j = i; j >= h && less(a[j], a[j-h]); j -= h)
                    exch(a, j, j-h);
            }

            h = h/3;
        }

        private static boolean less(Comparable v, Comparable w)
        { /* as before */ }
        private static void exch(Comparable[] a, int i, int j)
        { /* as before */ }
    }
}
```

3x+1 increment sequence

Insertion sort

move to next increment

Analysis

- The **worst-case** number of compares used by shell sort with the **3x+1** increments is $O(N^{3/2})$.

Merge Sort

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves.

input	M	E	R	G	E	S	O	R	T	E	X	A	M	P	L	E	
sort left half	E	E	G	M	O	R	R	S		T	E	X	A	M	P	L	E
sort right half	E	E	G	M	O	R	R	S		A	E	E	L	M	P	T	X
merge results	A	E	E	E	E	G	L	M	M	O	P	R	R	S	T	X	

Mergesort overview

Java implementation:

Merging:

```
private static void merge(Comparable[] a, Comparable[] aux, int lo, int mid, int hi)
{
    assert isSorted(a, lo, mid);    // precondition: a[lo..mid]    sorted
    assert isSorted(a, mid+1, hi);  // precondition: a[mid+1..hi] sorted

    for (int k = lo; k <= hi; k++)
        aux[k] = a[k];              copy

    int i = lo, j = mid+1;
    for (int k = lo; k <= hi; k++)
    {
        if (i > mid)                a[k] = aux[j++];
        else if (j > hi)            a[k] = aux[i++];
        else if (less(aux[j], aux[i])) a[k] = aux[j++];
        else                        a[k] = aux[i++];
    }

    assert isSorted(a, lo, hi);    // postcondition: a[lo..hi] sorted
}
```

	lo		i	mid		j		hi		
aux[]	A	G	L	O	R	H	I	M	S	T
a[]	A	G	H	I	L	M				

**Java implementation:****Merge Sort:**

```

public class Merge
{
    private static void merge(...)
    { /* as before */ }

    private static void sort(Comparable[] a, Comparable[] aux, int lo, int hi)
    {
        if (hi <= lo) return;
        int mid = lo + (hi - lo) / 2;
        sort(a, aux, lo, mid);
        sort(a, aux, mid+1, hi);
        merge(a, aux, lo, mid, hi);
    }

    public static void sort(Comparable[] a)
    {
        aux = new Comparable[a.length];
        sort(a, aux, 0, a.length - 1);
    }
}

```

Merge Sort: trace

	a[]															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Merge Sort: Empirical Analysis

	insertion sort (N^2)			mergesort ($N \log N$)		
computer	thousand	million	billion	thousand	million	billion
home	instant	2.8 hours	317 years	instant	1 second	18 min
super	instant	1 second	1 week	instant	instant	instant

Good algorithms are better than supercomputers.

**Divide-and-conquer recurrence: number of compares****Merge Sort analysis: memory (array accesses)**

- Mergesort uses extra space proportional to **N**.
- The array **aux[]** needs to be of size **N** for the last merge.

Practical Improvements:

- Use **insertion** sort for small subarrays:
 - Mergesort has too much overhead for tiny subarrays.
 - **Cutoff** to insertion sort for ≈ 7 items.

```
private static void sort(Comparable[] a, Comparable[] aux, int lo, int hi)
{
    if (hi <= lo + CUTOFF - 1)
    {
        Insertion.sort(a, lo, hi);
        return;
    }
    int mid = lo + (hi - lo) / 2;
    sort(a, aux, lo, mid);
    sort(a, aux, mid+1, hi);
    merge(a, aux, lo, mid, hi);
}
```

- Stop if already sorted:
 - Is biggest item in first half \leq smallest item in second half?
 - Helps for partially-ordered arrays.

```
private static void sort(Comparable[] a, Comparable[] aux, int lo, int hi)
{
    if (hi <= lo) return;
    int mid = lo + (hi - lo) / 2;
    sort(a, aux, lo, mid);
    sort(a, aux, mid+1, hi);
    if (!less(a[mid+1], a[mid])) return;
    merge(a, aux, lo, mid, hi);
}
```

- Eliminate the copy to the auxiliary array. Save time (but not space) by switching the role of the input and auxiliary array in each recursive call.

```
private static void merge(Comparable[] a, Comparable[] aux, int lo, int mid, int hi)
{
    int i = lo, j = mid+1;
    for (int k = lo; k <= hi; k++)
    {
        if (i > mid)      aux[k] = a[j++];
        else if (j > hi)  aux[k] = a[i++];
        else if (less(a[j], a[i])) aux[k] = a[j++];
        else              aux[k] = a[i++];
    }
}

private static void sort(Comparable[] a, Comparable[] aux, int lo, int hi)
{
    if (hi <= lo) return;
    int mid = lo + (hi - lo) / 2;
    sort(aux, a, lo, mid);
    sort(aux, a, mid+1, hi);
    merge(a, aux, lo, mid, hi);
}
```

← merge from a[] to aux[]

Note: sort(a) initializes aux[] and sets aux[i] = a[i] for each i.

↑ switch roles of aux[] and a[]

Complexity of sorting

- Compares? Mergesort is optimal with respect to number compares.
- Space? Mergesort is not optimal with respect to space usage.

Bottom-up Merge Sort

Basic plan:

- Pass through array, merging subarrays of size 1.
- Repeat for subarrays of size 2, 4, 8, 16,

					a[i]															
					0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

merge(a, aux, 8, 11, 15)					E	E	G	M	O	R	R	S	A	E	E	L	M	P	T	X
sz = 8					A	E	E	E	E	G	L	M	M	O	P	R	R	S	T	X
merge(a, aux, 0, 7, 15)																				

Java implementation

```

public class MergeBU
{
    private static void merge(...)
    { /* as before */ }

    public static void sort(Comparable[] a)
    {
        int N = a.length;
        Comparable[] aux = new Comparable[N];
        for (int sz = 1; sz < N; sz = sz+sz)
            for (int lo = 0; lo < N-sz; lo += sz+sz)
                merge(a, aux, lo, lo+sz-1, Math.min(lo+sz+sz-1, N-1));
    }
}

```

Quick Sort

Basic plan:

- Shuffle the array. (*shuffle needed for performance guarantee*)
- Partition so that, for some j
 - entry $a[j]$ is in place
 - no larger entry to the left of j
 - no smaller entry to the right of j
- Sort each piece recursively.

input Q U I C K S O R T E X A M P L E
 shuffle K R A T E L E P U I M Q C X O S
 partition E C A I E K L P U T M Q R X O S
 sort left A C E E I K L P U T M Q R X O S
 sort right A C E E I K L M O P Q R S T U X
 result A C E E I K L M O P Q R S T U X

Annotations: partitioning item (K), not greater (elements to the left of K), not less (elements to the right of K).

Quicksort t-shirt

Quicksort partitioning demo

Repeat until i and j pointers cross.

- Scan i from left to right so long as $(a[i] < a[lo])$.
- Scan j from right to left so long as $(a[j] > a[lo])$.
- Exchange $a[i]$ with $a[j]$.

When pointers (i and j) cross.

- Exchange $a[lo]$ with $a[j]$.

Quicksort: Java code for partitioning

```
private static int partition(Comparable[] a, int lo, int hi)
{
    int i = lo, j = hi+1;
    while (true)
    {
        while (less(a[++i], a[lo]))
            find item on left to swap
            if (i == hi) break;

        while (less(a[lo], a[--j]))
            find item on right to swap
            if (j == lo) break;

        if (i >= j) break;
        check if pointers cross
        swap
        exch(a, i, j);

        exch(a, lo, j);
        swap with partitioning item
        return j;
        return index of item now known to be in place
    }
}
```

```
public class Quick
{
    private static int partition(Comparable[] a, int lo, int hi)
    { /* see previous slide */ }

    public static void sort(Comparable[] a)
    {
        StdRandom.shuffle(a);
        sort(a, 0, a.length - 1);
    }

    private static void sort(Comparable[] a, int lo, int hi)
    {
        if (hi <= lo) return;
        int j = partition(a, lo, hi);
        sort(a, lo, j-1);
        sort(a, j+1, hi);
    }
}
```

Average-case analysis: Complicated $\rightarrow 2N \log N$

Quicksort: summary of performance characteristics

Worst case: Number of compares is quadratic.

- $N + (N - 1) + (N - 2) + \dots + 1 \approx \frac{1}{2}N^2$
- but this **rarely** to happen.

Average case: Number of compares is $\approx 1.39 N \lg N$

- 39% more compares than Mergesort
- But faster than Mergesort in practice because of less data movement.

Random shuffle

- Probabilistic guarantee against worst case.

Quicksort is an **in-place** sorting algorithm.

Quicksort is **not stable**.

DO NOT COPY

**Quicksort: practical improvements****1- Insertion sort small subarrays:**

- Even quicksort has too much overhead for tiny subarrays.
- **Cutoff** to insertion sort for ≈ 10 items.
- Note: could delay insertion sort until one pass at end.

```
private static void sort(Comparable[] a, int lo, int hi)
{
    if (hi <= lo + CUTOFF - 1)
    {
        Insertion.sort(a, lo, hi);
        return;
    }
    int j = partition(a, lo, hi);
    sort(a, lo, j-1);
    sort(a, j+1, hi);
}
```

2- Median of sample:

- Best choice of pivot item = median.
- Estimate true median by taking median of sample.

```
private static void sort(Comparable[] a, int lo, int hi)
{
    if (hi <= lo) return;

    int m = medianOf3(a, lo, lo + (hi - lo)/2, hi);
    swap(a, lo, m);

    int j = partition(a, lo, hi);
    sort(a, lo, j-1);
    sort(a, j+1, hi);
}
```
